Interest Rates: Central-bank expectations can influence currencies and broader asset pricing. Compare expectations with actual policy communication.

Inflation: CPI and related measures can change rate expectations. Compare actual data with consensus and previous readings, then observe market reaction.

Employment: Major employment releases can change expectations about economic momentum and policy and may cause rapid volatility.

Growth: GDP, retail sales and business surveys help frame whether an economy is accelerating or slowing.

Central Banks: Read the decision, statement and press-conference language together rather than relying on one headline.

Gold: Gold can react to real yields, the US dollar, inflation expectations, risk sentiment and geopolitical developments. These are context, not mechanical signals.

Event-Day Process: Know the release time; mark technical levels; define risk; avoid trading solely because volatility is rising; wait for your planned structure.

Educational notice: Economic releases can cause spread expansion, slippage and rapid price movement. This guide is educational.
