

TW NFP + CPI PLAYBOOK KIT

TW Trades Blueprint • Visual Edition

SnowFx | TW Trades

Event-driven price action without chasing the news spike.

NFP and CPI are high-impact U.S. releases. The BLS schedule lists Employment Situation and CPI releases at 8:30 a.m. Eastern Time; dates can change, so always verify the official calendar.

01 — TW EVENT-DAY COMMAND CENTER

The objective is not to predict whether the number will be good or bad. The objective is to wait for price to create a tradable structure.

Stage	What to mark / watch	TW decision
Before news	4H H/L, PDH/PDL, London/Asian H/L, S/R, supply/demand	Build map — no impulse entry
Release	First displacement + liquidity sweep	Observe, don't chase
Confirmation	Body-based BOS + retracement + ICC	Prepare entry
Execution	Defined invalidation + fixed risk	Enter only on confirmation
Management	Liquidity targets + R:R	Scale/exit by plan

TW MASTER FORMULA

L → D → B → R → ICC → E → T

Liquidity → Displacement → Body-based BOS → Retracement → ICC → Entry → Target

02 — TW NFP KIT

NFP = Employment Situation. It can produce rapid repricing and large intraday ranges. The TW model treats the initial spike as information, not automatically as an entry.

NFP VISUAL MODEL

Illustrative NFP fakeout: liquidity sweep → rejection → body BOS

Typical bearish reversal sequence: price sweeps a high → rejects → body closes back through structure → retraces → bearish ICC → sell.

NFP BUY MODEL

Sweep a meaningful low → downside displacement → rejection → bullish body BOS → retracement → bullish ICC → buy. Stop belongs beyond the structural invalidation; targets can be internal liquidity, previous high and HTF liquidity.

NFP SELL MODEL

Sweep a meaningful high → upside displacement → rejection → bearish body BOS → retracement → bearish ICC → sell. Stop belongs beyond the structural invalidation; targets can be internal liquidity, previous low and HTF liquidity.

NFP ENTRY CHECK

- HTF structure mapped
- Major liquidity marked
- NFP sweep occurred
- Displacement confirmed
- Body-based BOS confirmed
- Retracement completed
- ICC is clear
- Stop/invalidation is logical
- Risk is fixed
- No chasing

03 — TW CPI KIT

CPI = Consumer Price Index. It is a major inflation release and can sharply change expectations around rates, yields and the U.S. dollar. For TW, the same structural process applies: observe the reaction, then trade the confirmed structure.

CPI VISUAL MODEL

Illustrative CPI continuation: displacement → pullback → continuation

CPI SCENARIO A — CONTINUATION

CPI displacement breaks a meaningful level → price holds beyond it → retracement respects the new structure → ICC continuation appears. Trade only after confirmation.

CPI SCENARIO B — FAKEOUT

CPI spikes through a major high/low → fails to hold → body closes back inside → structure breaks in the opposite direction → retracement → ICC reversal.

CPI SCENARIO C — NO TRADE

Whipsaw, conflicting body closes, excessive spread, no clean BOS or no clear invalidation = stand aside.

CPI ENTRY CHECK

- Pre-CPI range mapped
- PDH/PDL + session liquidity marked
- Initial spike observed
- Body acceptance/rejection confirmed
- BOS confirmed
- Retracement + ICC present
- Risk/reward acceptable
- No emotional chase

04 — NFP vs CPI: TW DECISION MATRIX

Feature	NFP	CPI
Primary theme	Employment / labor market	Inflation / prices
TW focus	Liquidity sweep + displacement + structure	Displacement + acceptance/rejection + structure
Best mistake to avoid	Chasing the first spike	Trading the number instead of price
Core confirmation	Body-based BOS + ICC	Body-based BOS + ICC
Common reversal clue	Sweep + rejection + opposite BOS	Spike + failure to hold + opposite BOS
Preferred mindset	Let volatility reveal structure	Let repricing reveal structure

05 — BODY-BASED STRUCTURE RULE

A wick through a level is treated as a possible liquidity event, not automatic BOS. A body close beyond the relevant structure is stronger evidence of acceptance. The setup still requires context and confirmation.

06 — EVENT RISK & EXECUTION

High-impact releases can produce spread expansion, slippage and rapid price movement. A technically valid setup can still execute differently from the chart. Keep risk fixed and position size appropriate to the stop distance.

Suggested TW discipline rules

- Use a conservative fixed risk per attempt rather than increasing risk because volatility is high.
- Limit the number of attempts on a single event.
- Never widen a stop to avoid taking a loss.
- If the setup is missed, wait for another valid structure or accept that there is no trade.
- Record screenshots before and after the event for review.

FINAL GO / NO-GO

07 — EVENT JOURNAL

■ Liquidity event is identifiable

Field	Record
Event	NFP / CPI / other
Instrument	XAUUSD / EURUSD / GBPUSD / other
Pre-event bias	Bullish / Bearish / Neutral
Liquidity taken	High / Low / Both / None
Setup	Continuation / Reversal / No trade
Entry reason	BOS + retracement + ICC
Result	Win / Loss / Scratch
Lesson	What will I repeat or avoid?

08 — 2026 U.S. NFP + CPI REFERENCE

The official BLS 2026 calendar lists the Employment Situation and CPI releases at 8:30 a.m. Eastern Time. Always verify the live release calendar before trading because schedules can be updated.

Event	2026 reference dates shown by BLS
NFP / Employment Situation	Jan 9 • Feb 11 • Mar 6 • Apr 3 • May 8 • Jun 5 • Jul 2 • Aug 7 • Sep 4 • Oct 2 • Nov 6 • Dec 4
CPI	Jan 13 • Feb 13 • Mar 11 • Apr 10 • May 12 • Jun 10 • Jul 14 • Aug 12 • Sep 11 • Oct 14 • Nov 10 • Dec 10

09 — TW EVENT-DAY MANTRA

WAIT → CONFIRM → EXECUTE → MANAGE → WALK AWAY.

NFP creates volatility. CPI creates repricing. TW waits for the structure that follows.

EDUCATIONAL DISCLAIMER

This playbook is for educational purposes only and is not financial advice. Trading forex, CFDs, gold and indices involves substantial risk. High-impact news can cause rapid price movement, spread expansion and slippage. No setup is guaranteed. Verify economic-release times with the official BLS calendar before trading.
